In the Claims

This listing of claims will replace all prior versions, and listings, of claims.

Listing of Claims

- 1. (Original) A method for switching among a plurality of modes for ADSL modem operation, the method comprising the steps of: determining a far end modem's capability for supporting one or more of a base mode, a first mode and a second mode; determining a loop length between a near end modem and the far end modem; determining a capacity in an upper band of the first mode and the second mode; and selecting an appropriate mode based on a combination of the far end modem's capability, the loop length and the capacity in the upper band.
- 2. (Original) The method of claim 1, wherein the near end modem and the far end modem are trained in the base mode upon initial power up.
- 3. (Original) The method of claim 1, wherein the step of determining the capacity in the upper band further comprises determining whether the capacity in an upper 256 bins is below a threshold.
- 4. (Original) The method of claim 1, wherein the step of determining the capacity in the upper band further comprises determining whether the capacity in an upper 512 bins is below a threshold.

- 5. (Original) The method of claim 1, wherein the base mode is an Annex mode.
- 6. (Original) The method of claim 1, wherein the first mode is ADSL Plus.
- 7. (Original) The method of claim 1, wherein the second mode is ADSL Quad.
- 8. (Original) The method of claim 1, wherein the step of determining an appropriate mode is performed at a CO end.
- 9. (Original) The method of claim 8, wherein the steps are performed during a handshake/training session.
- 10. (Original) The method of claim 1, wherein the loop length is determined by a received power level calculation.
- 11. (Original) The method of claim 1, wherein the capacity in the upper band is determined at the far end modem and transmitted to the near end modem.
- 12. (Original) A system for switching among a plurality of modes for ADSL modem operation, the system comprising: a module for determining a far end modem's capability for supporting one or more of a base mode, a first mode and a second mode; a module for determining a loop length between a near end modem and the far end modem; and a module for determining a capacity in an upper band of the first mode and

the second mode; wherein an appropriate mode is selected based on a combination of the far end modem's capability, the loop length and the capacity in the upper band.

- 13. (Original) The system of claim 12, wherein the near end modem and the far end modem are trained in the base mode upon initial power up.
- 14. (Original) The system of claim 12, wherein determining the capacity in the upper band further comprises determining whether the capacity in an upper 256 bins is below a threshold.
- 15. (Original) The system of claim 12, wherein determining the capacity in the upper band further comprises determining whether the capacity in an upper 512 bins is below a threshold.
 - 16. (Original) The system of claim 12, wherein the base mode is an Annex mode.
 - 17. (Original) The system of claim 12, wherein the first mode is ADSL Plus.
 - 18. (Original) The system of claim 12, wherein the second mode is ADSL Quad.
- 19. (Original) The system of claim 12, wherein determining an appropriate mode is performed at a CO end.

- 20. (Original) The system of claim 19, wherein the system operates during a handshake/training session.
- 21. (Original) The system of claim 12, wherein the loop length is determined by a received power level calculation.
- 22. (Original) The system of claim 12, wherein the capacity in the upper band is determined at the far end modem and transmitted to the near end modem.
- 23. (Original) At least one processor readable carrier for storing a computer program of instructions configured to be readable by at least one processor for instructing the at least one processor to execute a computer process for performing the method as recited in claim 1.
 - 24. (Cancelled).
